

SERHII BABICH

Senior Product Engineer | Frontend Engineering

serhii@babich.dev | linkedin.com/in/babichss | Ukraine · Remote

SUMMARY

Product engineer with 15+ years of frontend experience across data-heavy applications, interactive tools, and complex browser systems. Turns ambiguous product problems into shipped solutions through discovery, scope definition, product and technical trade-offs, implementation, release, and production debugging.

SKILLS

Product engineering: Technical discovery, requirements and scope definition, workflow and solution design, feature ownership, stakeholder and UX collaboration, legacy modernization.

Frontend systems: JavaScript, TypeScript, HTML, CSS, browser APIs, component architecture, performance, data visualization, real-time interfaces, micro-frontends.

Frontend stack: React, Redux, TanStack Query; production experience with Angular, RxJS, and NgRx; working familiarity with Next.js, Express, Astro, and Vue.

Server-side & APIs: REST APIs, SSR/SSG, AI-assisted development of Python and Node.js services.

Quality: Jest, integration testing, Cypress, CI/CD, production debugging.

EXPERIENCE

Senior Software Engineer — DataRobot

Jul 2024–Sep 2026

Led delivery across three product areas: legacy-platform migration, model tuning, and customer-configurable evaluation. Partnered with Product and UX on scope and design while owning implementation, integration, testing, release, and production support.

- Shipped external test-set evaluation in the new UI within five months, using legacy-workflow research to consolidate dataset attachment into a single experiment-level entry point. Production use was confirmed across banking, chemicals, and manufacturing within two months of GA.
- Redesigned custom-metric package validation after identifying that users received feedback too late in the upload flow. Proposed progressive per-file validation, removing an extra validation step and changing the backend upload contract.
- Closed the remaining UI gap for Bayesian hyperparameter search as part of an escalated migration blocker. The requirement was tied to two opportunities worth \$828K combined, with the same need appearing across additional late-stage prospects and customer RFPs.
- Drove end-to-end integration for custom scoring metrics, a capability tied to \$374K in ARR at risk and a separate renewal blocker, covering the workflow from metric registration through experiment configuration and model optimization.
- Built an agentic engineering workflow that parallelized research, implementation, testing, and maintenance, allowing broader end-to-end ownership while retaining responsibility for problem framing, architecture, review, validation, and acceptance.

Frontend Engineer / Technical Coordinator — Edvantis

Official title: Frontend Solution Architect | Jun 2023–Jul 2024

Owned technical coordination across a 5–6 engineer team on a large logistics platform built with distributed micro-frontends, resolving cross-team dependencies and integration issues across frontend and backend systems.

- Introduced a discovery and scoping practice after identifying that incomplete upfront context was driving rework and missed estimates. Prepared discovery documentation and implementation-ready epics and stories with explicit scope, dependencies, and sequencing, reducing rework and improving delivery against estimates.
- Took a schema-mapping feature from discovery through implementation, reconstructing an under-documented mapping DSL encoded in CSV files, its syntax, and supported transformations. Designed and built a visual editor for common mapping scenarios, using a normalized in-memory data model, transformation layers, and virtualization to keep large nested schemas responsive.
- Reverse-engineered a tightly coupled inherited micro-frontend ahead of a rewrite, documenting its behavior, dependencies, and integration boundaries to turn legacy implementation details into actionable scope.

Lead Frontend Developer — SkillReveal

May 2021–Apr 2023

SkillReveal was an early-stage interview and assessment product. Joined at inception as the frontend lead within a six-person product team, working directly with the CEO on product scope, architecture, and technical trade-offs. Helped bring the product to MVP in three months; during my tenure, it reached 20 paying customers, ~4,000 registered users across client teams, interviewers, and candidates, and ~\$15K MRR.

- Owned frontend technical direction from the first commit, selecting the stack, libraries, and architecture to support fast iteration, implementation simplicity, and maintainability as the product evolved.
- Applied hands-on technical interviewing experience to the design of interview profiles, assessment structure, and candidate-evaluation workflows, working directly with the CEO on product scope and usability decisions.
- Refactored the assessment experience after tracing sluggish interactions to an overly coupled state model. Redesigned state and update flows to isolate scoring, comments, and derived results, reducing unnecessary recomputation and improving responsiveness across desktop and mobile.
- Built an in-house design system on top of Material UI, standardizing recurring UI patterns into reusable components adopted across the product.

Earlier Experience — 2011–2021

Jonny Git | N-iX | Lohika | GlobalLogic | Viseven

Progressed from Web Developer to Senior and Lead Frontend Engineer, working on browser-intensive products across analytics, trading, workflow tooling, media, and communication systems.

- **Data-heavy and performance-sensitive interfaces:** real-time trading interfaces, D3/SVG analytics dashboards, large datasets, and manual list virtualization.
- **Complex visual editors and configurable workflows:** visual questionnaire builders, schema-driven interfaces, video-processing editors, and real-time SVG manipulation.
- **Desktop applications with web technologies:** Node-WebKit messaging applications spanning multi-window UI, chat, voice/video calls, and file transfer.
- **Constrained browser environments:** HTML5 applications and browser-capability tooling for customized Opera-based media devices under tight memory and JavaScript performance constraints.

EDUCATION

Zhytomyr State Technological University

Control-System Automation coursework | 2004–2008

LANGUAGES

Ukrainian — Native | English — C1
