SERHII BABICH

Senior Frontend / Product Engineer

serhii@babich.dev · linkedin.com/in/babichss · Ukraine (EET, UTC+2/+3) · Remote · Open to employment or B2B contract

SUMMARY

Senior frontend / product engineer, 15+ years building data-heavy tools for power users: ML platforms, real-time trading, visual editors. At DataRobot, shipped **a** model-evaluation workflow adopted in banking, chemicals and manufacturing, and drove work tied to $828K in opportunities and $374K in at-risk ARR, from discovery through React implementation and backend API changes. Built a personal multi-agent engineering harness used daily across research, implementation and testing.

SKILLS

Frontend: TypeScript, JavaScript, React, Next.js, Redux, Redux Toolkit, TanStack Query, HTML, CSS, browser APIs; production Angular, RxJS, NgRx; also Astro, Vue

Specialties: data visualization (D3/SVG), virtualization of large trees and lists, real-time interfaces, micro-frontends, frontend performance, design systems

Backend & delivery: REST API integration and extension, AI-assisted Python endpoint work, SSR/SSG, Jest, Cypress, integration testing, CI/CD, production debugging

Product engineering: discovery and scoping, workflow design, legacy migration, staged delivery

Agentic engineering: agent harness design, human-in-the-loop validation, multi-agent orchestration, parallel agents in isolated git worktrees

EXPERIENCE

Senior Software Engineer

DataRobot · ML platform | Jul 2024 – Oct 2026

Technologies: React, Python, REST APIs, Jest, Cypress, integration testing

Owned the team's contribution to three Predictive AI product areas (model evaluation, custom metrics, model tuning), spanning discovery, UX, React implementation, Python API changes, integration testing, release and production investigation.

- **Enabled customers to evaluate models against their own test data in the new product, with production adoption confirmed in banking, chemicals and manufacturing within two months of GA.** Delivered it in five months: owned domain and legacy-flow research, requirements, frontend technical design and implementation, delivery sequencing and testing; consolidated multiple proposed upload points into one experiment-level entry point and staged delivery across five incremental releases.
- **Closed a model-tuning feature gap blocking a key customer's migration to the new platform**, a requirement tied to $828K across two opportunities, plus other prospects and RFPs at a late stage. Delivered the remaining Bayesian hyperparameter search UI during the escalation, including strategy selection and conditional settings, validated with backend engineers.
- **Drove customer-defined evaluation metrics from an API-only capability toward a full product workflow**, a workstream tied to $374K in at-risk ARR and a renewal blocker. Defined scope, built the React workflows, shipped Python endpoint and payload changes with AI assistance plus integration tests, and traced why custom metrics couldn't drive optimization to two backend validation paths that assumed built-in metrics; the fix was merged.
- **Simplified custom-metric setup by replacing an end-of-upload validation step with real-time feedback on each file.** Challenged the proposed two-file flow in Product/UX review and designed progressive per-file validation with pair cross-validation; the adopted design changed the Python API contract to accept files separately.
- **Kept up to four work tracks moving in parallel by designing and building a personal agentic engineering harness**, used daily across research, implementation, API work and testing. Bounded tasks go to specialized agents in isolated worktrees, while problem framing, architecture, review and acceptance stay human-owned.

Frontend Solution Architect

Edvantis · Logistics platform | Jun 2023 – Jul 2024

Technologies: React, TypeScript, Redux Toolkit, micro-frontend architecture

Combined hands-on frontend engineering with technical coordination in a 5–6 engineer team: the technical contact for frontend leads, backend engineers, feature architects and adjacent teams, turning incomplete requirements and undocumented dependencies into scoped work.

- **Enabled users to map customer database schemas visually instead of hand-writing CSV.** Took the editor from discovery to implementation for common mapping scenarios: reconstructed the under-documented mapping DSL, formalized the workflow with the feature architect, and built a normalized in-memory model, bidirectional transformation layers and virtualized tree rendering that stays responsive on 1,000–2,000-node schemas.
- **Introduced an upfront discovery step that turned incomplete requirements into implementation-ready work**, piloted after missing context caused rework and missed estimates. Produced discovery notes, technical designs and epics with explicit scope, dependencies, blockers and sequencing, giving engineers clear context before estimation.
- **De-risked a planned micro-frontend rewrite** by reverse-engineering a tightly coupled inherited micro-frontend and turning its behavior and frontend/backend dependencies into actionable rewrite scope.

Lead Frontend Developer

SkillReveal · Interview and assessment SaaS | May 2021 – Apr 2023

Technologies: React, TypeScript, Next.js, Recoil, Material UI

Joined at inception as frontend lead in a six-person team, working directly with the CEO on prioritization, feasibility and usability.

- **Helped deliver the MVP in three months from a few initial design screens**; by 2023 the product reached 20 paying customers, ~4,000 registered users across client teams, interviewers and candidates, and ~$15K MRR.
- **Shaped the product beyond the frontend, drawing on hands-on technical interviewing experience.** Proposed more flexible interview profiles and influenced usability and UI decisions for the assessment experience.
- **Set a frontend architecture at the first commit that carried the product from MVP onward and contributed to its late-stage migration from a React SPA to Next.js**: selected the stack and an atomic state model (Recoil) separating UI from data, then extended Material UI into an internal design system used across the product.
- **Owned performance as a core part of the product's user experience, keeping interactions fluid on desktop and mobile.** Traced sluggish candidate scoring to page-wide rerenders from an overly coupled state model and redesigned the data and update flows so a score change re-rendered only the affected component; shipped to production, and users reported better responsiveness, especially on mobile.

Earlier Experience

Lead Frontend Developer · 2020–2021 | Jonny Git
Lead Frontend Developer · 2017–2020 | N-iX
Frontend Developer · 2014–2017 | Lohika
JavaScript Developer · 2013–2014 | GlobalLogic
Web Developer · 2011–2013 | Viseven

- **Data-heavy analytics (Jonny Git, Lohika):** turned dense, fast-changing data into responsive, explorable interfaces. Built the frontend of a Git-activity analytics product from scratch at inception (React, TypeScript, Recoil, Material UI); built custom D3/SVG visualizations and from-scratch list virtualization for a real-time analytics platform (Ractive.js).
- **Real-time trading (N-iX):** proved a browser migration path for a .NET trading application with a web proof of concept, then built its performance-sensitive real-time interface (Angular, TypeScript, NgRx).
- **Visual builders (N-iX):** let users compose questionnaires visually from reusable components into JSON configurations, with an editor built from scratch; improved the stability and performance of a video-processing pipeline editor with real-time SVG manipulation (React, TypeScript, Redux).
- **Desktop and constrained environments (GlobalLogic):** took a Chrome-extension messenger to a cross-platform desktop product with chat, voice and video calls, file and location sharing (node-webkit, Knockout.js); built HTML5 apps and a browser capability test for memory-constrained media-player devices.
- **Interactive presentations (Viseven):** built guided, interactive e-detailing apps for pharma sales reps on a custom JavaScript engine, plus a lightweight CSS framework that standardized layouts, chart markup and interaction patterns across projects.
